Calculating Angles Associated with Skewed Columns

Using Vector Notation and Direction Cosines

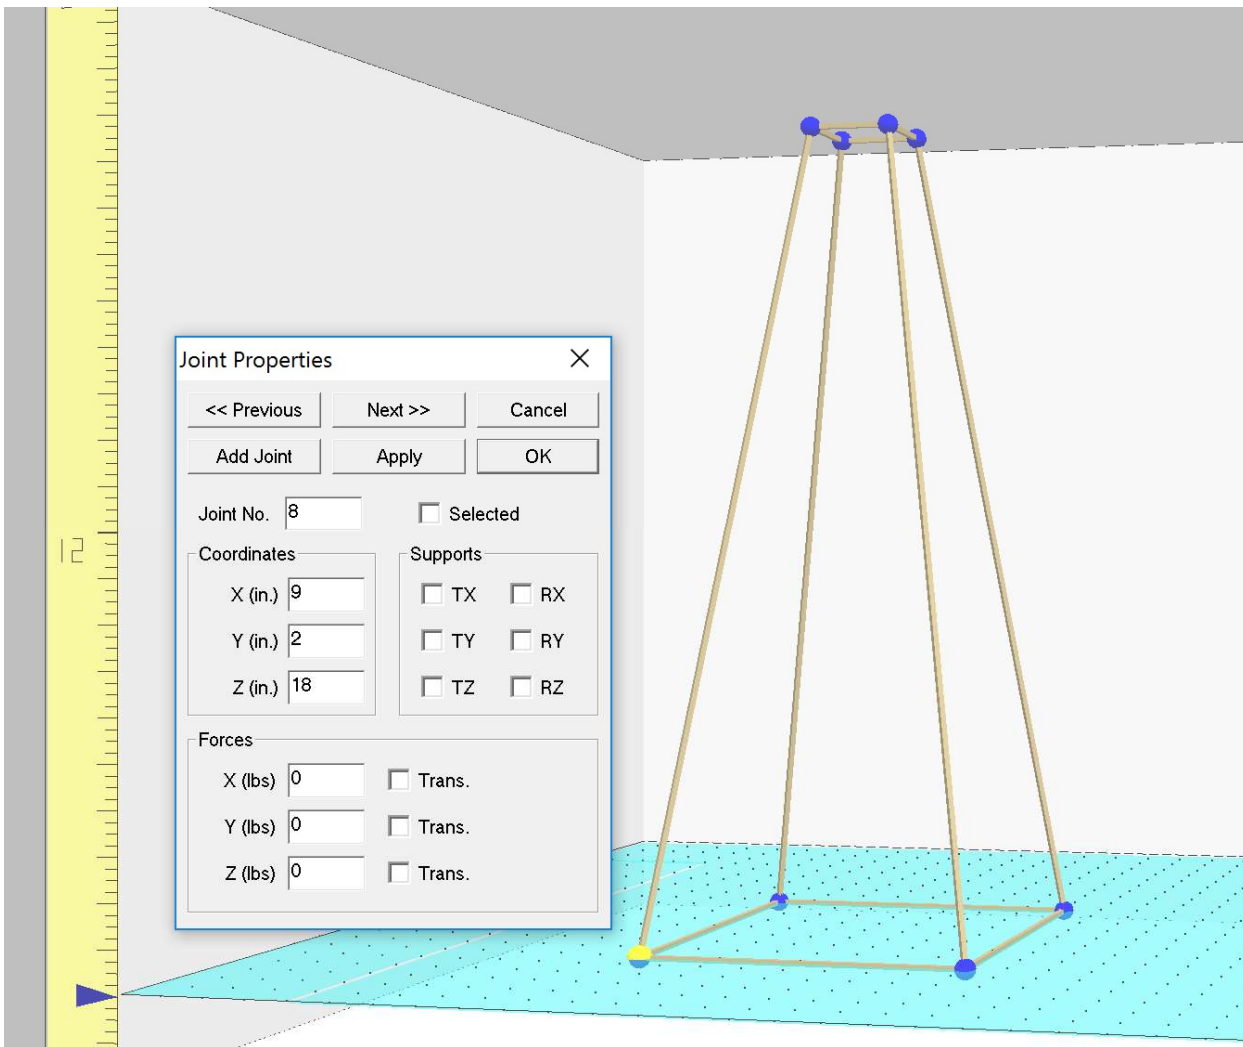

This example uses vector notation to determine the angles associated with a skewed column.

Let's consider member number 3.

From the "Member Properties" dialog we see that this member starts at joint number 1 and ends at joint number 8. The actual length of the member is 20.445 inches.

From the “Joint Properties” dialog we see that joint number 8 has the following coordinates:

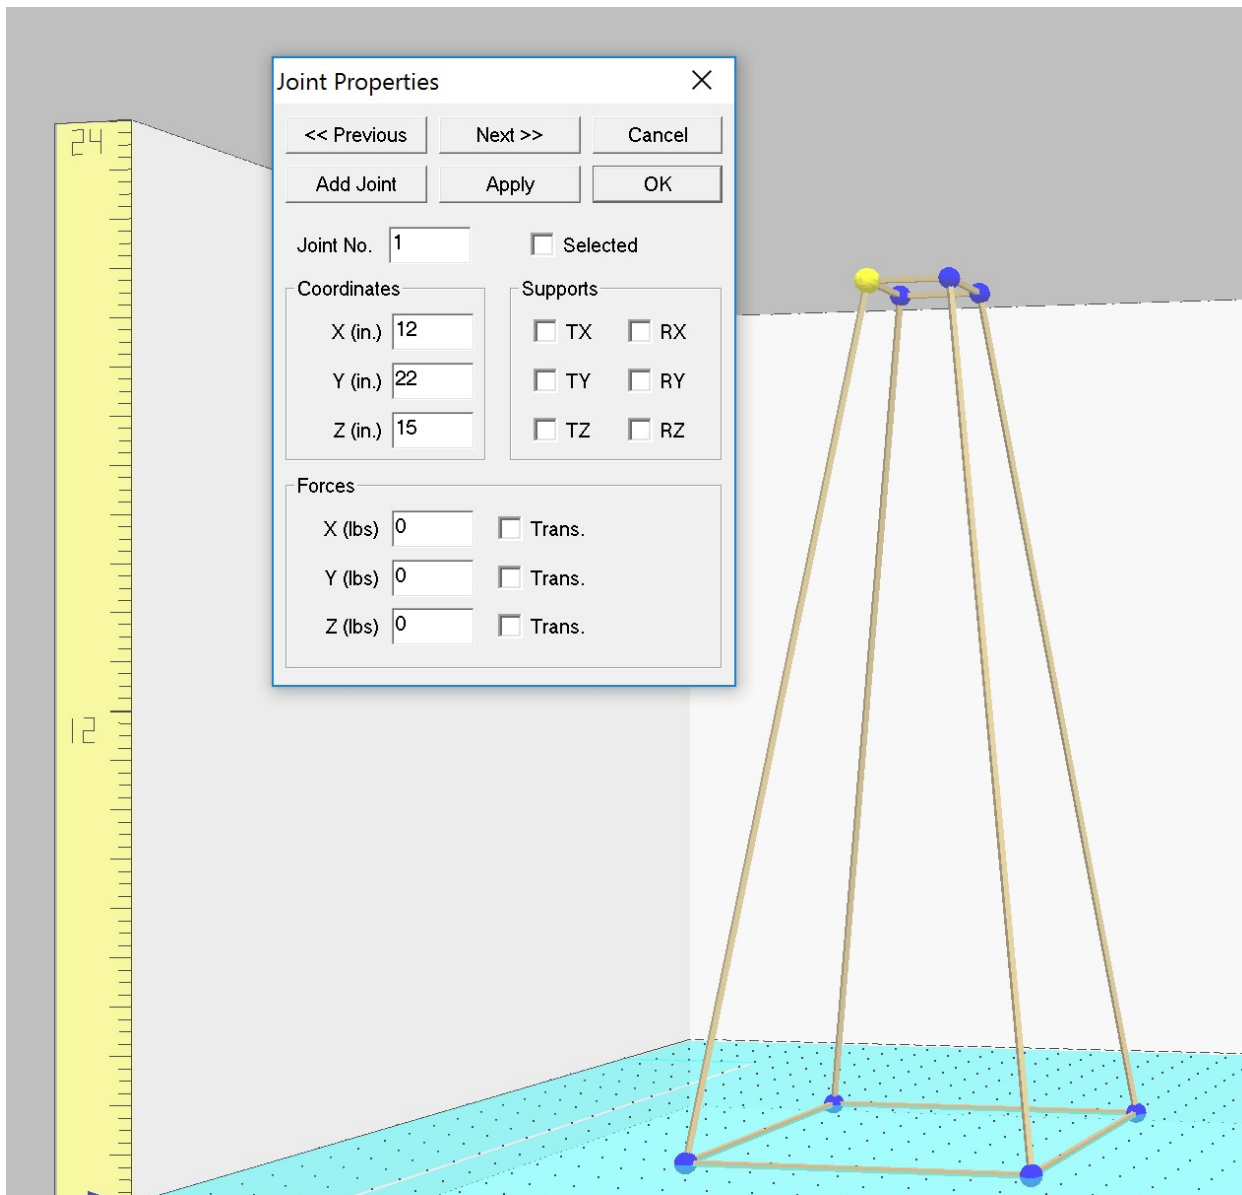

X=9

Y=2

Z=18

For the calculations let’s call this location node 1 and use the following notation:

$X_1 = 9$ $Y_1 = 2$ $Z_1 = 18$

From the “Joint Properties” dialog we see that joint number 8 has the following coordinates:

X=12

Y=22

Z=15

$X_2 = 12$ $Y_2 = 22$ $Z_2 = 15$

Using vector notation to represent the column we get the following:

$$\mathbf{C} = dX\mathbf{i} + dY\mathbf{j} + dZ\mathbf{k}$$

where the bold "C" denotes a vector with a change in the global "X" direction directed along a unit vector \mathbf{i} pointing the global X direction.

$$dX = X_2 - X_1 = 12 - 9 = 3 \quad (\text{change in the } \mathbf{i} \text{ direction})$$

$$dY = Y_2 - Y_1 = 22 - 2 = 20$$

$$dZ = Z_2 - Z_1 = 15 - 18 = -3$$

$$\mathbf{C} = 3\mathbf{i} + 20\mathbf{j} - 3\mathbf{k}$$

The magnitude of vector \mathbf{C} (denoted as C) is:

$$C = \sqrt{(dX)^2 + (dY)^2 + (dZ)^2}$$

$$C = \sqrt{(3)^2 + (20)^2 + (-3)^2}$$

$$C = \sqrt{418}$$

$$C = 20.445 \quad (\text{as it should})$$

Now convert \mathbf{C} to a unit vector directed along the same axis as column 3:

$$\mathbf{c} = \mathbf{C}/C = \mathbf{C}/20.445 = (3\mathbf{i} + 20\mathbf{j} - 3\mathbf{k})/20.445 = .14674\mathbf{i} + .97823\mathbf{j} - .14674\mathbf{k}$$

The coefficients of the unit vectors **i**, **j** and **k** are the angle cosines.

$\text{Cosine}^{-1}(.97823) = 11.98^\circ$ (this is the angle in degrees from the Y direction to the column. The column is inclined by $90 - 11.98 = 78.02$ degrees or about 78°)

$\text{Cosine}^{-1}(.14674) = 81.56^\circ$ (this is the angle in degrees from the X direction to the column.

$\text{Cosine}^{-1}(-.14674) = -98.438^\circ$ (this is the angle in degrees from the Z direction to the column.
